Flow of Coolant in the Saab 900

The coolant flow begins at the water pump, which pushes coolant through the engine block and cylinder head, absorbing heat. From there, it moves to the radiator via hoses, where it releases heat into the air. The cooled coolant then cycles back to the engine, completing the loop.

Step-by-step coolant flow:

- Water Pump:** Circulates coolant from the radiator to the engine.
- Engine Block & Cylinder Head:** Absorb heat from combustion.
- Thermostat:** Controls coolant flow based on engine temperature. When closed, coolant is diverted back to the engine for quicker warm-up. When open, coolant flows through the radiator.
- Radiator:** Dissipates heat into the environment.
- Cooling Fan:** Activates as needed to aid heat dissipation, especially in slow traffic or high-temperature conditions.
- Overflow Reservoir:** Manages coolant expansion and maintains system pressure.

Role of Thermostat in the Cooling System Diagram

The thermostat acts as a gatekeeper in the cooling diagram. It ensures the engine warms up quickly by restricting coolant flow to the radiator when cold. Once optimal temperature is reached, it opens, allowing coolant to flow through the radiator for cooling.

Key points about the thermostat:

- Typically operates between 80°C to 90°C.
- Failing thermostat can cause overheating or overcooling.
- Replacement is often necessary during major cooling system

repairs. Common Issues and Troubleshooting Using the Cooling Diagram Understanding the diagram allows for efficient troubleshooting. Here are common problems and how the cooling diagram helps diagnose them:
