Multiple Choice Sample Question
Question: Which of the following best explains why a cell's membrane is considered semi-permeable?
A) It allows all substances to pass freely.
B) It blocks all substances from entering or leaving the cell.
C) It permits some substances to pass while blocking others.
D) It only allows water to pass through.
Answer: C) It permits some substances to pass while blocking others.

Short Answer Sample Question
Question: Describe the role of the nucleus in a eukaryotic cell. Include in your answer the types of molecules it contains and their functions.
Sample Response: The nucleus acts as the control center of a eukaryotic cell. It contains the cell's DNA, which carries genetic information necessary for cell activities and reproduction. The nucleus also contains nucleolus, where ribosomes are assembled. Its primary functions include regulating gene expression, controlling cell growth, and coordinating cell division.

Extended Response Sample Question
Question: Explain how natural selection can lead to the evolution of a species. Use an example to support your explanation.
Sample Response: Natural selection leads to evolution when individuals with advantageous traits are more likely to survive and reproduce, passing those traits to their offspring. Over generations, these traits become more common in the population. For example, in a population of birds, if some have beaks better suited for cracking hard seeds, those birds are more likely to survive during food shortages. Their offspring inherit the stronger beak trait, and over time, the species' beak morphology may evolve to be larger and stronger.
