Sample Solutions from Saxon Geometry Lesson 68

Below are example solutions typical of Lesson 68 exercises. These will help clarify the types of questions and the detailed reasoning involved.

Example 1: Calculating the Sum of Interior Angles in a Polygon
Question: Find the sum of the interior angles of a decagon.
Solution: The formula for the sum of interior angles in an n -sided polygon is: $\text{Sum} = (n - 2) \times 180^\circ$
 For a decagon ($n = 10$): $(10 - 2) \times 180^\circ = 8 \times 180^\circ = 1440^\circ$
Answer: The sum of the interior angles of a decagon is 1440 degrees.

Example 2: Properties of a Rhombus
Question: Prove that the diagonals of a rhombus are perpendicular.
Solution: Recall that a rhombus is a parallelogram with all sides equal. In a rhombus, the diagonals bisect each other. Use coordinate geometry or geometric proof: Draw rhombus ABCD with diagonals AC and BD intersecting at point O. Show that triangles AOB and COD are congruent by Side-Angle-Side (SAS). Use properties of congruent triangles to conclude that diagonals are perpendicular. Alternatively, apply the definition of a rhombus and properties of parallelograms to establish the perpendicularity of diagonals.
Answer: The diagonals of a rhombus bisect each other at right angles, so they are perpendicular.

Example 3: Applying the Pythagorean Theorem in a Triangle
Question: Find the length of the hypotenuse in a right triangle with legs measuring 6 cm and 8 cm.
Solution: Using the Pythagorean theorem: $c^2 = a^2 + b^2$
 $c^2 = 6^2 + 8^2 = 36 + 64 = 100$
 $c = \sqrt{100} = 10 \text{ cm}$
Answer: The hypotenuse is 10 centimeters long.

sides Practice problems involving real-world geometric applications Understanding the answers to Lesson 68 enables students to verify their problem-solving strategies and deepen their comprehension of the concepts involved.

Key Concepts Covered in Saxon Geometry Lesson 68

Triangle Congruence and Its Criteria

One of the core focuses is on establishing when two triangles are congruent. The lesson typically highlights:

- Side-Angle-Side (SAS):** When two sides and the included angle of one triangle are equal to the corresponding parts of another triangle.
- Angle-Side-Angle (ASA):** When two angles and the included side are equal.
- Side-Side-Side (SSS):** When all three sides are equal.
- Hypotenuse-Leg (HL):** Specific to right triangles, involving the hypotenuse and one leg.

Properties of Isosceles and Equilateral Triangles

Understanding the characteristics, such as:

- Equal sides and angles in isosceles triangles
- All sides and angles in equilateral triangles being equal
- The angle bisector, median, and altitude coincide in equilateral triangles

Triangle Angle Sum Theorem

A foundational concept stating that the interior angles of any triangle sum to 180° . This theorem is fundamental in solving many problems in Lesson 68.

Use of Auxiliary Lines and Geometric Proofs

Students learn to introduce lines, points, or segments to facilitate proofs. Constructing auxiliary lines helps establish relationships between angles and sides that are not immediately obvious.

Typical Problems and Their Solutions in Saxon Geometry Lesson 68

Example Problem 1: Proving Triangle Congruence

Problem Statement: Given two triangles, with two pairs of corresponding sides equal and the included angles equal, prove that the triangles are congruent.

Solution Approach:

- Identify the Given Data:** Side $AB \cong$ Side DE , Side $AC \cong$ Side DF , Included angles at A and D are equal.
- Apply the SAS Criterion:** Since two sides and the included angle are congruent, triangles ABC and DEF are congruent by SAS.
- Conclude:** Corresponding angles are equal, and all sides are equal, confirming congruence.

Example Problem 2: Using the Isosceles Triangle Theorem

Problem Statement: In triangle ABC , $AB \cong AC$. If the base angles at B and C are equal, find the measure of angles B and C if angle A measures 50° .

Solution Steps:

- Recognize that $AB \cong AC$ implies triangle ABC is isosceles with base BC . The base angles at B and C are equal; denote each as x .
- Sum of interior angles: $50^\circ + x + x = 180^\circ$
- $50^\circ + 2x = 180^\circ$
- $2x = 130^\circ$
- $x = 65^\circ$

Answer: The base angles are each 65° .

Example Problem 3: Applying Theorem to Find Unknowns

Problem Statement: In triangle PQR , $PQ \cong PR$, and the measure of angle P is 40° . Find the measures of angles Q and R .

Solution:

- Since $PQ \cong PR$, triangle PQR is isosceles with P as the vertex angle. The sum of interior angles: $40^\circ + 2x = 180^\circ$ (because angles at Q and R are equal, each denoted as x)
- Solve for x : $40^\circ + 2x = 180^\circ$
- $2x = 140^\circ$
- $x = 70^\circ$

Conclusion: Angles Q and R each measure 70° .
